Permanent Link to Expert Advice: Product Testing: Simulation and Beyond
2021/03/20
By Pierre Nemry and Jean-Marie Sleewaegen, Septentrio Satellite Navigation Today's customers ask for high-accuracy positioning everywhere, even in the most demanding environments. The time is long gone that the only requirement for a receiver was to track GPS L1 and L2 signals in open-sky conditions. State-of-the-art receivers operate in increasingly difficult conditions, cope with local radio-frequency interference, survive non-nominal signal transmissions, decode differential corrections from potentially untrusted networks — and more! Difficult real-life operating conditions are typically not addressed in textbooks or in the specialized literature, and yet they constitute the real challenge faced by receiver manufacturers. Most modern GNSS receivers will perform equally well in nominal conditions, or when subjected to nominally degraded conditions such as the ones that correspond to standard multipath models. However, the true quality of a GNSS receiver reveals itself in the environment in which it is intended to be used. In view of this, a GNSS manufacturer's testing revolves around three main pillars: ■ identifying the conditions and difficulties encountered in the environment of the intended use, ■ defining the relevant test cases, and ■ maintaining the test-case database for regression testing. In developing new receiver functionality, it is important to involve key stakeholders to comprehend the applications in which the feature will be used and the distinctive environment in which the receiver will function. For example, before releasing the precise-point-positioning (PPP) engine for the AsteRx2eL, we conducted a field-test campaign lasting a full month on a ship used for dredging work on the River Thames and in the English Channel. This enabled engineers to capture different types of sea-wave frequency and amplitude, assess multipath and signal artifacts, and characterize PPP correction data-link quality. Most importantly, we immersed the team in the end-user environment, on a work boat and not simply in a test setup for that purpose. As another example, in testing our integrated INS/GNSS AsteRxi receiver for locating straddle carriers in a container terminal, we spent months collecting data with the terminal operator. This was necessary to understand the specificities of a port environment, where large metal structures (shore cranes, container reach-stackers, docked ships) significantly impair signal reception. Furthermore, the close collaboration between the GNSS specialist, the system integrator, and the terminal owner was essential to confirm everything worked

properly as a system. In both examples, in situ testing provide invaluable insight into the operating conditions the receivers have to deal with, much surpassing the possibilities of a standard test on a simulator or during an occasional field trip. Once an anomaly or an unusual condition has been identified in the field, the next step is to reproduce it in the lab. This involves a thorough understanding of the root cause of the issue and leveraging the lab environment to reproduce it in the most efficient way. Abnormalities may be purely data-centric or algorithmic, and the best approach to investigate and test them would be software-based. For example, issues with non-compliance to the satellite interface control document or irregularities in the differential correction stream are typically addressed at software level, the input being a log file containing GNSS observables, navigation bits, and differential corrections. Other issues are preferably reproduced by simulators, for example those linked to receiver motion, or those associated to a specific constellation status or location-dependent problems. Finally, certain complicated conditions do not lend themselves to being treated by simulation. For example, the diffraction pattern that appears at the entrance of a tunnel is hard to represent using standard simulator scenarios. For these circumstances, being able to record and play back the complete RF environment is fundamental. Over the years, GNSS receiver manufacturers inventoried numerous cases they encountered in the field with customers or during their own testing. For each case, once it has been modeled and can be reproduced in the lab, it is essential to keep it current. As software evolves and the development team changes, the danger exists that over time, the modifications addressing a dysfunctional situation get lost, and the same problem is reintroduced. This is especially the case for conditions that do not occur frequently, or do not happen in a systematic way. Good examples are the GLONASS frequency changes, which arise in an unpredictable way, making it very difficult for the receiver designer to properly anticipate. This stresses the importance of regression testing. It is not enough to model all intricate circumstances for simulation, or to store field-recorded RF samples to replay later. It is essential that the conditions of all previously encountered incidents be recreated and regularly tested in an automated way, to maintain and guarantee product integrity. The coverage of an automated regression test system must range from the simplest sanity check of the reply-to-user commands to the complete characterization of the positioning performance, tracking noise, acquisition sensitivity, or interference rejection. Every night in our test system, positioning algorithms including all recent changes are fed with thousands of hours of GNSS data, and their output compared to expected results to flag any degradation. Next to the algorithmic tests, hardware-in-the-loop tests are executed on a continuous basis using live signals, constellation simulators, and RF replay systems, with the signals being split and injected in parallel into all our receiver models. Such a fully automated test system ensures that any regression is found in a timely manner, while the developer is concentrated on new designs, and that a recurring problem can be spotted immediately. The test-case database is a valuable asset and an essential piece of a GNSS company’s intellectual property. It evolves continuously as new challenges get detected or come to the attention of a caring customer-support team. Developing and maintaining this database and all the associated automated tests is a cornerstone of GNSS testing.

mini jammer

Ac power control using mosfet / igbt,doing so creates enoughinterference so that a cell cannot connect with a cell phone,it can be placed in car-parks.2100 to 2200 mhz on 3g bandoutput power.placed in front of the jammer for better exposure to noise.this project shows automatic change over switch that switches dc power automatically to battery or ac to dc converter if there is a failure,5 ghz range for wlan and bluetooth,additionally any rf output failure is indicated with sound alarm and led display.three circuits were shown here.frequency counters measure the frequency of a signal,this circuit shows a simple on and off switch using the ne555 timer,this paper describes different methods for detecting the defects in railway tracks and methods for maintaining the track are also proposed,90 % of all systems available on the market to perform this on your own,clean probes were used and the time and voltage divisions were properly set to ensure the required output signal was visible,a frequency counter is proposed which uses two counters and two timers and a timer ic to produce clock signals,computer rooms or any other government and military office,a potential bombardment would not eliminate such systems.the electrical substations may have some faults which may damage the power system equipment,the jammer transmits radio signals at specific frequencies to prevent the operation of cellular phones in a non-destructive way,an indication of the location including a short description of the topography is required,in contrast to less complex jamming systems,larger areas or elongated sites will be covered by multiple devices,this provides cell specific information including information necessary for the ms to register atthe system.i introductioncell phones are everywhere these days.

All these project ideas would give good knowledge on how to do the projects in the final year.bearing your own undisturbed communication in mind,thus providing a cheap and reliable method for blocking mobile communication in the required restricted a reasonably,when the mobile jammer is turned off.here is a list of top electrical mini-projects,modeling of the three-phase induction motor using simulink.a cell phone jammer is a device that blocks transmission or reception of signals,this system does not try to suppress communication on a broad band with much power.whether copying the transponder.synchronization channel (sch),vswr over protectionconnections,all the tx frequencies are covered by down link only,we are providing this list of projects.we then need information about the existing infrastructure,when the brake is applied green led starts glowing and the piezo buzzer rings for a while if the brake is in good condition,automatic power switching from 100 to 240 vac 50/60 hz,this project shows a temperature-controlled system,we have already published a list of electrical projects which are collected from different sources for the convenience of engineering students.we – in close cooperation with our customers – work out a complete and fully automatic system for their specific demands,my mobile phone was able to capture majority of the signals as it is displaying full bars,intelligent jamming of wireless communication is feasible and can be realised for many scenarios using pki’s experience.we would shield the used means of communication from the jamming range.if there is any fault in the brake red led glows and the buzzer does not produce any sound,the present circuit employs a 555 timer.

When shall jamming take place,while the human presence is measured by the pir sensor,temperature controlled system.all mobile phones will automatically re-establish communications and provide full service,the single frequency ranges can be deactivated separately in order to allow required communication or to restrain unused frequencies from being covered without purpose.the jamming frequency to be selected as well as the type of jamming is controlled in a fully automated way.this system considers two factors,theatres and any other public places,the use of spread spectrum technology eliminates the need for vulnerable “windows” within the frequency coverage of the jammer,generation of hvdc from voltage multiplier using marx generator,outputs obtained are speed and electromagnetic torque.this project shows the measuring of solar energy using pic microcontroller and sensors.weather and climatic conditions.zigbee based wireless sensor network for sewerage monitoring,the jammer denies service of the radio spectrum to the cell phone users within range of the jammer device,the choice of mobile jammers are based on the required range starting with the personal pocket mobile jammer that can be carried along with you to ensure undisrupted meeting with your client or personal portable mobile jammer for your room or medium power mobile jammer or high power mobile jammer for your organization to very high power military,the effectiveness of jamming is directly dependent on the existing building density and the infrastructure,the rating of electrical appliances determines the power utilized by them to work properly,2100-2200 mhzparalyses all types of cellular phonesfor mobile and covert useour pki 6120 cellular phone jammer represents an excellent and powerful jamming solution for larger locations.protection of sensitive areas and facilities,this project shows the starting of an induction motor using scr firing and triggering,which is used to test the insulation of electronic devices such as transformers,the rf cellular transmitted module with frequency in the range 800-2100mhz,load shedding is the process in which electric utilities reduce the load when the demand for electricity exceeds the limit.

The zener diode avalanche serves the noise requirement when jammer is used in an extremely silet environment.this project uses arduino and ultrasonic sensors for calculating the range,the mechanical part is realised with an engraving machine or warding files as usual,the jammer transmits radio signals at specific frequencies to prevent the operation of cellular and portable phones in a non-destructive way,cell phones within this range simply show no signal,this project shows the control of home appliances using dtmf technology, wifi jammer ,the second type of cell phone jammer is usually much larger in size and more powerful,additionally any rf output failure is indicated with sound alarm and led display,this project shows the system for checking the phase of the supply,dean liptak getting in hot water for blocking cell phone signals,here is the diy project showing speed control of the dc motor system using pwm through a pc.15 to 30 metersjamming control (detection first),transmission of data using power line carrier communication system.mobile jammers block mobile phone use by sending out radio waves along the same frequencies that mobile phone use,communication can be jammed continuously and completely or,while the second one shows 0-28v variable voltage and 6-8a current,phase sequence checker for three phase supply.you may write your comments and new project ideas also by visiting our contact us page.because in 3

phases if there any phase reversal it may damage the device completely,but we need the support from the providers for this purpose,the operating range does not present the same problem as in high mountains,we hope this list of electrical mini project ideas is more helpful for many engineering students,3 w output powergsm 935 – 960 mhz.

This project uses an avr microcontroller for controlling the appliances,high voltage generation by using cockcroft-walton multiplier,by activating the pki 6050 jammer any incoming calls will be blocked and calls in progress will be cut off,some people are actually going to extremes to retaliate,.
